

Yellow Long Neck Fig

Yellow Long Neck Fig

Ficus carica 'Yellow Long Neck'

Height: 10 feet

Spread: 12 feet

Sunlight: ○ ●

Hardiness Zone: 8a

Description:

An attractive deciduous garden tree producing sweet greenish-yellow fruit in fall; great for fresh eating or baking; attracts birds; prune in late winter to maintain size and shape

Edible Qualities

Yellow Long Neck Fig is a small tree that is typically grown for its edible qualities, although it does have ornamental merits as well. It produces yellow fruit (technically 'pomes') with a chartreuse blush and gold flesh which are usually ready for picking from early to mid fall. The fruits have a sweet taste and a fleshy texture.

The fruit are most often used in the following ways:

- Fresh Eating
- Baking
- Preserves
- Pickling

Features & Attributes

Yellow Long Neck Fig has attractive dark green foliage with chartreuse veins on a tree with a round habit of growth. The lobed leaves are highly ornamental but do not develop any appreciable fall colour. The fruits are showy yellow pomes with a chartreuse blush, which are carried in abundance in mid fall. The fruit can be messy if allowed to drop on the lawn or walkways, and may require occasional clean-up.

This is a multi-stemmed deciduous tree with a more or less rounded form. Its average texture blends into the landscape, but can be balanced by one or two finer or coarser trees or shrubs for an effective composition. This plant will require occasional maintenance and upkeep, and is best pruned in late winter once the threat of extreme cold has passed. It is a good choice for attracting birds to your yard, but is not particularly attractive to deer who tend to leave it alone in favor of tastier treats. It has no significant negative characteristics.

Aside from its primary use as an edible, Yellow Long Neck Fig is suitable for the following landscape applications;

Yellow Long Neck Fig

- Accent
- Hedges/Screening
- General Garden Use
- Container Planting

Planting & Growing

Yellow Long Neck Fig will grow to be about 10 feet tall at maturity, with a spread of 12 feet. It has a low canopy with a typical clearance of 1 foot from the ground, and is suitable for planting under power lines. It grows at a medium rate, and under ideal conditions can be expected to live for 50 years or more.

This tree is quite ornamental as well as edible, and is as much at home in a landscape or flower garden as it is in a designated edibles garden. It does best in full sun to partial shade. It does best in average to evenly moist conditions, but will not tolerate standing water. It is not particular as to soil type or pH, and is able to handle environmental salt. It is highly tolerant of urban pollution and will even thrive in inner city environments. Consider applying a thick mulch around the root zone in both summer and winter to conserve soil moisture and protect it in exposed locations or colder microclimates. This is a selected variety of a species not originally from North America.

Yellow Long Neck Fig is a good choice for the edible garden, but it is also well-suited for use in outdoor pots and containers. Because of its height, it is often used as a 'thriller' in the 'spiller-thriller-filler' container combination; plant it near the center of the pot, surrounded by smaller plants and those that spill over the edges. It is even sizeable enough that it can be grown alone in a suitable container. Note that when grown in a container, it may not perform exactly as indicated on the tag - this is to be expected. Also note that when growing plants in outdoor containers and baskets, they may require more frequent waterings than they would in the yard or garden. Be aware that in our climate, most plants cannot be expected to survive the winter if left in containers outdoors, and this plant is no exception. Contact our experts for more information on how to protect it over the winter months.
