# Stiff Goldenrod Solidago rigida

Height: 4 feet

Spread: 24 inches Spacing: 20 inches

Sunlight: O •

Hardiness Zone: 2b

#### **Ornamental Features**

Stiff Goldenrod has masses of beautiful gold flat-top flowers at the ends of the stems from late summer to mid fall, which are most effective when planted in groupings. Its narrow leaves remain green in colour throughout the season.

#### **Landscape Attributes**

Stiff Goldenrod is an herbaceous perennial with an upright spreading habit of growth. Its medium texture blends into the garden, but can always be balanced by a couple of finer or coarser plants for an effective composition.

- Spreading
- Self-Seeding

Stiff Goldenrod is recommended for the following landscape applications;

- Mass Planting
- General Garden Use
- Naturalizing And Woodland Gardens

#### **Planting & Growing**

Stiff Goldenrod will grow to be about 4 feet tall at maturity, with a spread of 24 inches. When grown in masses or used as a bedding plant, individual plants should be spaced approximately 20 inches apart. It tends to be leggy, with a typical clearance of 1 foot from the ground, and should be underplanted with lower-growing perennials. It grows at a fast rate, and under ideal conditions can be expected to live for approximately 10 years. As an herbaceous perennial, this plant will usually die back to the crown each winter, and will regrow from the base each spring. Be careful not to disturb the crown in late winter when it may not be readily seen!

This plant does best in full sun to partial shade. It prefers to grow in average to moist conditions, and shouldn't be allowed to dry out. It is not particular as to soil type or pH. It is highly tolerant of urban pollution and will even thrive in inner city environments. This species is native to parts of North America. It can be propagated by division.
