

Coast Iris
Iris longipetala

Plant Height: 18 inches

Flower Height: 24 inches

Spread: 24 inches

Spacing: 18 inches

Sunlight:

Hardiness Zone: 7a

Other Names: Central Coast Iris

Description:

This low clumping native variety does well in coastal environments, but also thrives elsewhere with some attention; attractive lavender, purple, to white blooms with yellow signals over grassy, narrow foliage; great as a low groundcover

Ornamental Features

Coast Iris features showy lavender flag-like flowers with white overtones, yellow throats and deep purple veins at the ends of the stems from early to late spring. The flowers are excellent for cutting. Its narrow leaves remain bluish-green in color throughout the season.

Landscape Attributes

Coast Iris is an herbaceous perennial with an upright spreading habit of growth. Its relatively fine texture sets it apart from other garden plants with less refined foliage.

This plant will require occasional maintenance and upkeep, and should be cut back in late fall in preparation for winter. Deer don't particularly care for this plant and will usually leave it alone in favor of tastier treats.

Gardeners should be aware of the following characteristic(s) that may warrant special consideration;

- Insects

Coast Iris is recommended for the following landscape applications;

- Mass Planting
- Border Edging
- General Garden Use
- Groundcover
- Naturalizing And Woodland Gardens
- Bog Gardens

Planting & Growing

Coast Iris will grow to be about 18 inches tall at maturity extending to 24 inches tall with the flowers, with a spread of 24 inches. When grown in masses or used as a bedding plant, individual plants should be spaced approximately 18 inches apart. It grows at a medium rate, and under ideal conditions can be expected to live for approximately 10 years. As an herbaceous perennial, this plant will usually die back to the crown each winter, and will regrow from the base each spring. Be careful not to disturb the crown in late winter when it may not be readily seen!

This plant does best in full sun to partial shade. You may want to keep it away from hot, dry locations that receive direct afternoon sun or which get reflected sunlight, such as against the south side of a white wall. It is an amazingly adaptable plant, tolerating both dry conditions and even some standing water. This plant does not require much in the way of fertilizing once established. It is not particular as to soil pH, but grows best in clay soils, and is able to handle environmental salt. It is somewhat tolerant of urban pollution. This species is native to parts of North America. It can be propagated by division.
