

Springtime Lawson Falsecypress
Chamaecyparis lawsoniana 'Springtime'

Height: 4 feet

Spread: 24 inches

Sunlight:

Hardiness Zone: 4

Other Names: Oregon Cedar, Port Orford Cedar

Description:

A spectacular slow growing cultivar featuring lime-green and yellow new foliage over underlying green older foliage; conical in shape with a compact habit; an attractive low hedge as well as an accent shrub for the landscape

Ornamental Features

Springtime Lawson Falsecypress is a dwarf conifer which is primarily valued in the landscape or garden for its distinctively pyramidal habit of growth. It has attractive forest green-variegated lime green foliage with hints of chartreuse which emerges yellow in spring. The scale-like sprays of foliage are highly ornamental and turn coppery-bronze in the fall, which persists throughout the winter. The shaggy antique red bark adds an interesting dimension to the landscape.

Landscape Attributes

Springtime Lawson Falsecypress is a multi-stemmed evergreen shrub with a distinctive and refined pyramidal form. Its relatively fine texture sets it apart from other landscape plants with less refined foliage.

This is a relatively low maintenance shrub. When pruning is necessary, it is recommended to only trim back the new growth of the current season, other than to remove any dieback. It has no significant negative characteristics.

Springtime Lawson Falsecypress is recommended for the following landscape applications;

- Accent
- Mass Planting
- Hedges/Screening
- General Garden Use

Planting & Growing

Springtime Lawson Falsecypress will grow to be about 4 feet tall at maturity, with a spread of 24 inches. It has a low canopy. It grows at a slow rate, and under ideal conditions can be expected to live for 70 years or more.

This shrub does best in full sun to partial shade. It prefers to grow in average to moist conditions, and shouldn't be allowed to dry out. It may require supplemental watering during periods of drought or extended heat. It is not particular as to soil type, but has a definite preference for acidic soils. It is somewhat tolerant of urban pollution. Consider applying a thick mulch around the root zone in winter to protect it in exposed locations or colder microclimates. This is a selection of a native North American species.
