

**Red Alder**  
*Alnus rugosa*

Height: 20 feet

Spread: 15 feet

Sunlight:

Hardiness Zone: 2

Other Names: Speckled Alder, Smooth Alder

**Description:**

A great small tree for difficult wet locations, will almost grow in standing water; no particularly striking ornamental features, but an overall neat and well-behaved tree

**Ornamental Features**

Red Alder has forest green deciduous foliage on a tree with an upright spreading habit of growth. The oval leaves turn yellow in fall.

**Landscape Attributes**

Red Alder is a deciduous tree with an upright spreading habit of growth. Its average texture blends into the landscape, but can be balanced by one or two finer or coarser trees or shrubs for an effective composition.

This is a relatively low maintenance tree, and is best pruned in late winter once the threat of extreme cold has passed. It has no significant negative characteristics.

Red Alder is recommended for the following landscape applications;

- Shade

**Planting & Growing**

Red Alder will grow to be about 20 feet tall at maturity, with a spread of 15 feet. It has a low canopy with a typical clearance of 4 feet from the ground, and is suitable for planting under power lines. It grows at a medium rate, and under ideal conditions can be expected to live for 50 years or more.

This tree does best in full sun to partial shade. It is quite adaptable, preferring to grow in average to wet conditions, and will even tolerate some standing water. It may require supplemental watering during periods of drought or extended heat. It is not particular as to soil type or pH. It is highly tolerant of urban pollution and will even thrive in inner city environments. Consider applying a thick mulch around the root zone in winter to protect it in exposed locations or colder microclimates. This species is native to parts of North America.
