

Dolchica Spirea

Spiraea x bumalda 'Dolchica'

Height: 24 inches

Spread: 3 feet

Sunlight:

Hardiness Zone: 4a

Other Names: Spiraea japonica

Description:

A delicate garden detail shrub featuring small flat-topped clusters of carmine-pink flowers and unusual toothed and crinkled foliage; excellent for garden texture effect and in groupings, needs full sun and well-drained soil

Ornamental Features

Dolchica Spirea features showy clusters of pink flowers at the ends of the branches from late spring to early summer. It has bluish-green deciduous foliage which emerges deep purple in spring. The small crinkled pointy leaves turn an outstanding coppery-bronze in the fall.

Landscape Attributes

Dolchica Spirea is a multi-stemmed deciduous shrub with a more or less rounded form. Its relatively fine texture sets it apart from other landscape plants with less refined foliage.

This shrub will require occasional maintenance and upkeep, and is best pruned in late winter once the threat of extreme cold has passed. It is a good choice for attracting butterflies to your yard, but is not particularly attractive to deer who tend to leave it alone in favor of tastier treats. It has no significant negative characteristics.

Dolchica Spirea is recommended for the following landscape applications;

- Mass Planting
- Rock/Alpine Gardens
- General Garden Use

Planting & Growing

Dolchica Spirea will grow to be about 24 inches tall at maturity, with a spread of 3 feet. It tends to fill out right to the ground and therefore doesn't necessarily require facer plants in front. It grows at a fast rate, and under ideal conditions can be expected to live for approximately 20 years.

This shrub should only be grown in full sunlight. It prefers to grow in average to moist conditions, and shouldn't be allowed to dry out. It is not particular as to soil type or pH. It is highly tolerant of urban pollution and will even thrive in inner city environments. This particular variety is an interspecific hybrid.
