This is a dense multi-stemmed evergreen houseplant with an upright spreading habit of growth. Its extremely fine and delicate texture is quite ornamental and should be used to full effect. This plant may benefit from an occasional pruning to look its best.

### Planting & Growing

When grown indoors, Denham's Melicope can be expected to grow to be about 6 feet tall at maturity, with a spread of 4 feet. It grows at a slow rate, and under ideal conditions can be expected to live for approximately 30 years. This houseplant will do well in a location that gets either direct or indirect sunlight, although it will usually require a more brightly-lit environment than what artificial indoor lighting alone can provide. It prefers to grow in average to moist soil. The surface of the soil shouldn't be allowed to dry out completely, and so you should expect to water this plant once and possibly even twice each week. Be aware that your particular watering schedule may vary depending on its location in the room, the pot size, plant size and other conditions; if in doubt, ask one of our experts in the store for advice. It will benefit from a regular feeding with a general-purpose fertilizer with every second or third watering. It is not particular as to soil type or pH; an average potting soil should work just fine.

Use the information described here as a guideline only; individual performance can and will vary. Please contact the store to speak with one of our experts if you are interested in further details concerning recommendations on pot size, watering, pruning, repotting, etc.
